

API Request / Response Example

A simple worked example

This shows one request to a fictional API that returns a user. The client sends an HTTP request; the server replies with a status code and a JSON body.

Request

```
GET /v1/users/42 HTTP/1.1
Host: api.example.com
Authorization: Bearer <token>
Accept: application/json
```

Response

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "id": 42,
  "name": "Sara Ahmed",
  "email": "sara@example.com",
  "role": "editor",
  "active": true
}
```

Creating a resource (POST)

Request

```
POST /v1/users HTTP/1.1
Host: api.example.com
Content-Type: application/json

{
  "name": "Omar Ali",
  "email": "omar@example.com",
  "role": "viewer"
}
```

Response

```
HTTP/1.1 201 Created
Location: /v1/users/43
Content-Type: application/json
```

```
{
  "id": 43,
  "name": "Omar Ali",
  "email": "omar@example.com",
  "role": "viewer",
  "active": true
}
```

What to notice

- GET /users/42 reads one user; the 200 status means success.
- POST /users creates a user; the 201 status and Location header point to the new resource.
- The Authorization header carries the token that proves who you are.
- The body is JSON — the standard format for REST payloads.
