

Git Workflow Example

A short, everyday flow

A typical feature-branch workflow: you branch off main, make changes, commit them, push, and open a pull request for review before merging.

1. Get the latest code

```
git checkout main
git pull origin main
```

2. Create a feature branch

```
git checkout -b feature/add-login
```

3. Check what you changed

```
git status
git diff
```

4. Stage and commit

```
git add .
git commit -m "Add login form and validation"
```

5. Push your branch

```
git push -u origin feature/add-login
```

6. Open a pull request

```
# On GitHub/GitLab: open a PR from
# feature/add-login into main, request a review
```

7. Update after review, then merge

```
git checkout main
git pull origin main
# merge the PR once approved
```

Tips

- Commit small and often, with clear messages.

- Pull main before branching so you start from the latest code.
- One branch = one focused change; it makes review easier.
- Never commit secrets (tokens, passwords) — use a .gitignore.
